

INSTRUCTIONS FOR STANDARD GM TYPE TURN SIGNALS

Main wires for turnsignals are included in harness. Power & flasher wires must be supplied. If you are adding turnsignals to your pickup, this type of system does not require extra lamps mounted on front & rear of pickup. This way, your truck can retain its original appearance, while having the convenience of turnsignals. Stoplamps & rear turnsignals operate on one wire & taillamps operate on the other wire. However, front parklamps must be converted to double filament bulbs because one wire will be needed for front parklamps & another wire will be needed for front turnsignals. We can supply a kit for this conversion. Please inquire!
